***Information Disclosure Statement***

1. The information disclosure statement (IDS) submitted on 11/28/2003 is being considered by the examiner.

***Claim Rejections - 35 USC § 102***

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

2. Claims 1-7 are rejected under 35 U.S.C. 102(e) as being anticipated by DeLong et al (US 6,160,842).

Regarding claims 1, 4 and 5, DeLong discloses an apparatus and a method for using the apparatus for decoding serially received data bits encoded on a bus voltage as a pattern of first and second logic levels (figure 2). A period for a data bit is established which identifies the start and end of each bit (figure 2 and column 8, lines 10-35). At the start of each bit of a command word, up/down counter 67 is reset to an initial count value (column 8, lines 17-19). The logic level is detected on the bus. At the start of the bit, the counter begins counting down, when the voltage transitions to a new voltage level, the counter begins counting up (column 8, lines 17-21). At the end of each

bit, the final count value is compared to the initial count value to determine the logic value of each bit (column 8, lines 21-25).

Regarding claims 2 and 6, DeLong further discloses if the final count is greater than the initial count, the logic value of the bit is a one. If the final count is less than the initial count, the logic value is a zero (column 8, lines 25-35).

Regarding claims 3 and 7, the voltage waveform detector comprises a filter 75 (column 7, lines 42-43) and figure 2 shows the voltage of the signal is compared to intermediate levels  $V_{LL}$  and  $V_{HL}$  to determine when transitions occur and what data values the signal is encoded to.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Kevin M. Burd whose telephone number is (571) 272-3008. The examiner can normally be reached on Monday - Thursday 9 am - 5 pm.
